As biomedical research generates ever-growing requirements for large sample sizes, it has increasingly depended on biorepositories to provide biosamples and data. These large collections decrease the time and expense required to answer important research questions, however, a single biorepository is often inadequate. As big data questions have come to play a central role in medical research, multiple biorepositories are being linked into networks with the aim of building giant “virtual” biorepositories. In this presentation, we will discuss the ethical and legal issues that arise for biorepository networks.

Thursday, Nov. 30
12:00 p.m. - 1:00 p.m.
